Image Formation

Digital Camera

The Eye

How do we see the world?

Let's design a camera

- Idea 1: put a piece of film in front of an object
- Do we get a reasonable image?

Pinhole camera

Add a barrier to block off most of the rays

- This reduces blurring
- The opening known as the **aperture**
- How does this transform the image?

Camera Obscura: the pre-camera

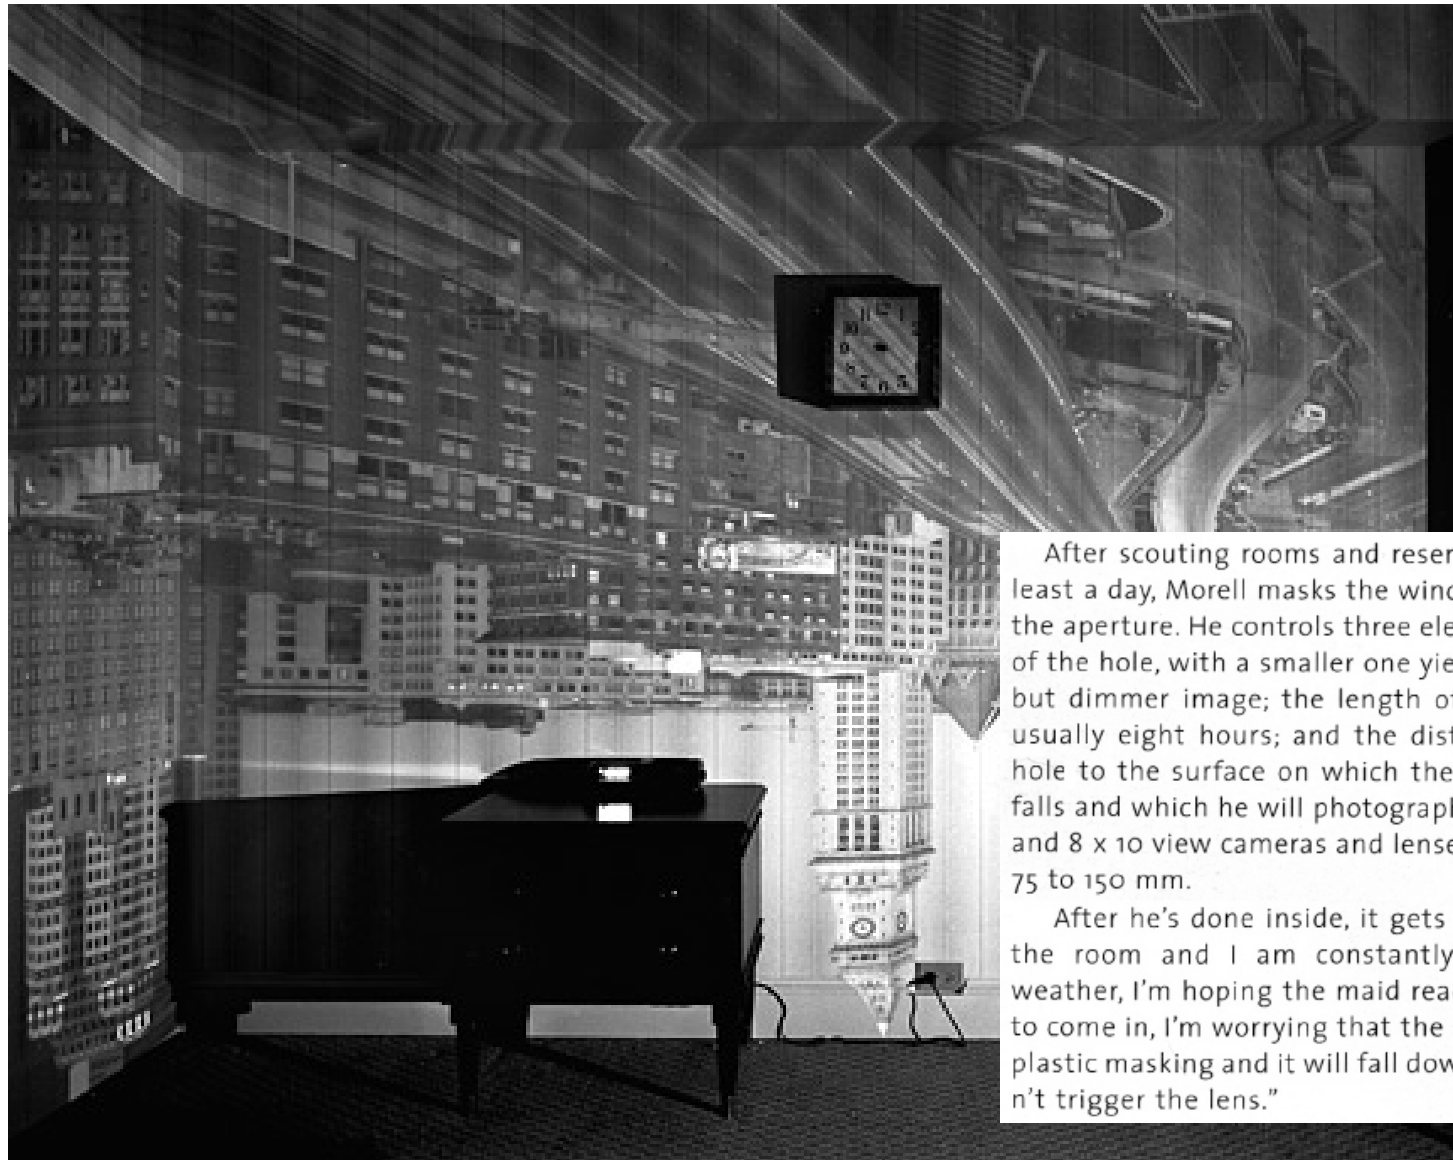

- First Idea: Mo-Ti, China (470-390 BC)
- First build: Al Hacem, Iraq/Egypt (965-1039 AD)

Drawing aid for artists:
described by Leonardo
da Vinci (1452-1519)

Camera Obscura near Cliff House

8-hour exposure (Abelardo Morell)

After scouting rooms and reserving one for at least a day, Morell masks the windows except for the aperture. He controls three elements: the size of the hole, with a smaller one yielding a sharper but dimmer image; the length of the exposure, usually eight hours; and the distance from the hole to the surface on which the outside image falls and which he will photograph. He used 4 x 5 and 8 x 10 view cameras and lenses ranging from 75 to 150 mm.

After he's done inside, it gets harder. "I leave the room and I am constantly checking the weather, I'm hoping the maid reads my note not to come in, I'm worrying that the sun will hit the plastic masking and it will fall down, or that I didn't trigger the lens."

Accidental pinhole cameras

My hotel room,
contrast enhanced.

The view from my window

Accidental pinholes produce images that are
unnoticed or misinterpreted as shadows

Torralba and Freeman, CVPR'12

Accidental pinhole camera

Window turned into a pinhole

View outside

Pinhole camera model

Pinhole model:

- Captures **pencil of rays** – all rays through a single point
- The point is called **Center of Projection (COP)**
- The image is formed on the **Image Plane**
- **Effective focal length d** is distance from COP to Image Plane

Modeling projection

The coordinate system

- We will use the pin-hole model as an approximation
- Put the optical center (**C**enter **O**f **P**rojection) at the origin
- Put the image plane (**P**rojection **P**lane) *in front* of the COP
= Why?
- The camera looks down the *negative z axis*
 - we need this if we want right-handed-coordinates

Modeling projection

Projection equations

- Compute intersection with PP of ray from (x,y,z) to COP
- Derived using similar triangles (on board)

$$(x, y, z) \rightarrow \left(-d\frac{x}{z}, -d\frac{y}{z}, -d\right)$$

- We get the projection by throwing out the last coordinate:

$$(x, y, z) \rightarrow \left(-d\frac{x}{z}, -d\frac{y}{z}\right)$$

Dimensionality Reduction Machine (3D to 2D)

2D image

Why did evolution opt for such strange solution?

- Nice to have a passive, long-range sensor
- Can get 3D with stereo or by moving around, plus experience

Study: People Far Away From You Not Actually Smaller

NEWS • Science & Technology • ISSUE 49•34 • Aug 22, 2013

Researchers say that, contrary to prior assertions, the subject above stands at equal height at left and at right, and does not grow smaller as he walks away from the camera.

Lengths can't be trusted...

...but humans adopt!

Müller-Lyer Illusion

We don't make measurements in the image plane

Other projections: Orthographic

Special case of perspective projection

- Distance from the COP to the PP is infinite

- Also called “parallel projection”
- $x' = x$
- $y' = y$

Scaled Orthographic or “Weak Perspective”

$$\text{If } \Delta z \ll -\bar{z} : \begin{array}{l} x' \approx -mx \\ y' \approx -my \end{array} \quad m = -\frac{f}{\bar{z}}$$

Justified if scene depth is small relative to average distance from camera

Scaled Orthographic or “Weak Perspective”

Spherical Projection

What if PP is spherical with center at COP?

In spherical coordinates, projection is trivial:

$$(\theta, \phi) = (\theta, \phi, d)$$

Note: doesn't depend on focal length f !

Building a real camera

Another way to make pinhole camera

Why so
blurry?

Shrinking the aperture

Why not make the aperture as small as possible?

- Less light gets through
- Diffraction effects...

Shrinking the aperture

The reason for lenses

Replacing pinholes with lenses

Photography,
London et al

Focus

Focus and Defocus

A lens focuses light onto the film

- There is a specific distance at which objects are “in focus”
 - other points project to a “circle of confusion” in the image
- Changing the shape of the lens changes this distance

Thin lenses

Thin lens equation:
$$\frac{1}{d_o} + \frac{1}{d_i} = \frac{1}{f}$$

- Any object point satisfying this equation is in focus
- What is the shape of the focus region?
- Thin lens applet: http://www.phy.ntnu.edu.tw/java/Lens/lens_e.html (by Fu-Kwun Hwang)

Varying Focus

Varying Focus

(c)

Depth Of Field

Depth of Field

Aperture controls Depth of Field

Changing the aperture size affects depth of field

- A smaller aperture increases the range in which the object is approximately in focus
- But small aperture reduces amount of light – need to increase exposure

F-number: focal length / aperture diameter

Varying the aperture

From London and Upton

FOV depends of Focal Length

Size of field of view governed by size of the camera retina:

$$\varphi = \tan^{-1}\left(\frac{d}{2f}\right)$$

Smaller FOV = larger Focal Length

Expensive toys...

Lens Flaws

Lens Flaws: Chromatic Aberration

Dispersion: wavelength-dependent refractive index

- (enables prism to spread white light beam into rainbow)

Modifies ray-bending and lens focal length: $f(\lambda)$

color fringes near edges of image

Corrections: add 'doublet' lens of flint glass, etc.

Chromatic Aberration

Chromatic Aberration

Near Lens Center

Near Lens Outer Edge

Radial Distortion (*e.g.* 'Barrel' and 'pin-cushion')

straight lines curve around the image center

Radial Distortion

Radial distortion of the image

- Caused by imperfect lenses
- Deviations are most noticeable for rays that pass through the edge of the lens

Radial Distortion
